< Development Cooperation Handbook | Designing and Managing Programme objectives. Programme formulation is the process of choosing the who, what, how, when, and where of persuing programme objectives: these are</p> specified at the project specification level. Program formulation provides a framework where different projects, sharing the same overall objectives, can be conceived and implemented in a co-ordinated manner. A good programme design will give answers to the following questions: What is the cultural and policy approach that is expected to be used in the implementation methodologyWhat is the expected quality standard and how to achieve it?How will the programme? How are cross-sectoral issues of development considered in the programme? Programme? How to achieve it?How will the programme? How are cross-sectoral issues of development considered in the programme? How are cross-sectoral issues of development considered in the programme? Issue 8 How to design and manage successful cooperational Types Organizational Structure Organizational Types Organizational Structure Organization The employee empowering organizations The Organizations wision The Organizations wision The Organizations vision Designing and Managers Projects The 3 level hierarchy of programme Managers and programme Managers Program Formulation and Preparation is a critical phase within the Program Managers and programme Managers Program Managers and programme Managers Program Formulation and Preparation is a critical phase within the Program Life Cycle Management. This stage lays the foundational groundwork for a successful program managers engage in comprehensive needs analysis to identify the problem or opportunity the program intends to address. This involves stakeholder analysis to understand and document the expectations, requirements, and potential impacts on various parties involvedPreparation entails developing a detailed program plan that outlines the roadmap for achieving the desired outcomes. This includes establishing clear program objectives, setting measurable goals, and defining key performance indicators (KPIs) to monitor progress. Resource planning is a crucial component, where managers allocate necessary resources such as budget, personnel, and technology, ensuring this phase to anticipate potential challenges and devise mitigation plans. Establishing governance structures and decision-making protocols ensures that the program remains aligned with organizational priorities and can adapt to changes or unforeseen issues effectively. Additionally, communication plans are crafted to facilitate transparent and consistent information flow among stakeholders, fostering collaboration and buy-inAnother essential aspect is the development of a program schedule that outlines, milestones, and deliverables, providing a clear timeline for execution and accountability. By thoroughly addressing these elements during the Formulation and Preparation phase, program managers set a solid foundation that enhances the likelihood of program success. This stage ensures that all aspects are meticulously planned and that the program is strategically positioned to deliver value, meet its objectives, and contribute positively to the organizations mission and vision. Effective formulation and preparation not only streamline the execution phase but also provide a framework for monitoring, controlling, and ultimately achieving the program sintended benefits. Program life cycle, laying the groundwork for successful program execution. It involves clearly defining the program's objectives, scope, and expected benefits while aligning them with the organization's strategic goals. Why it's important: Thorough program formulation and preparation ensures that the program formulation and preparation ensures that the program formulation and preparation ensures that the program is well-defined, properly scoped, and has the necessary resources and stakeholder support to achieve its objectives. It helps to:- Align the program with organizational strategy- Identify and engage key stakeholders- Establish clear goals and success criteria- Plan for resource allocation and risk management Plan- Establishing the program Formulation and Preparation involves:- Defining the program Konter and program formulation and Preparation involves:- Defining the program Konter and the program governance structure- Identifying and prioritizing program components and projects- Assessing program risks and planning for risk managementHow it works:1. Program Definition: Clearly define the program's purpose, objectives, and expected benefits, ensuring alignment with the organization's strategy.2. Stakeholder Engagement: Identify and analyze key stakeholders, their interests, and their influence on the program. Develop a stakeholder engagement plan to effectively communicate and manage their expectations. Program Charter and Management plan to effectively communicate and manag governance structure. Create a program management plan that details how the program will be executed, monitored, and controlled.4. Program Governance: Establish a governance: Establish a governance structure that defines roles, responsibilities, and decision-making processes for the program.5. Program Components and Projects: Identify and prioritize the projects and other work that will be undertaken to achieve the program's objectives.6. Risk Assessment and Planning: Identify potential risks that could impact the program's objectives.6. Risk Assessment and Planning: Identify potential risks that could impact the key and the key an concepts and processes involved in program formulation, such as defining objectives, engaging stakeholders, and establishing governance.2. Be familiar with the contents and projects based on their alignment with the program's objectives and expected benefits.4. Recognize the importance of risk assessment and planning during the formulation and preparation to scenario-based questions, identifying the most appropriate actions or decisions based on the given context. Test mode: Program formulation is the first and critical stage in the program life cycle. It's where the vision is articulated, the strategy is crafted, and the blueprint for the entire program is laid out. It's akin to an architect drafting the initial plans for a magnificent building, ensuring that every detail aligns with the intended outcome. While it is true, parts of this early vision may need to change or be adjusted based on broader company/team need (so dont be rigid, flexibility is key) - this is where the overarching purpose of the program is defined. What are those objectives relevant for what you are doing? (Try to get down to the base principles that are driving the work). What does success look like in 1 month, 1 quarter, 1 year? These questions form the cornerstone of the program's direction. Strategic Alignment: Here, the program's goals are aligned with the broader organizational strategy (assuming there is one). This ensures that the program contributes meaningfully to the company's overall objectives and does not operate in isolation. If you dont have something to work from, then work backwards to define the base principles of your team/work/organization and create goals that are geared toward ensuring success of you and the company. Stakeholder Identification and Analysis: Understanding who the stakeholders are, their interests, and their influence is crucial. This step involves mapping out all the parties that will be affected by or can affect the program. Lets be honest though - this isnt always as straightforward as it may seem - especially if youre new to a team or area. So do your best to write down names, responsibilities, and meet LOTS of people - and define how they may or may not fit into your stakeholder map. Then, be sure to update that map frequently as you move forward. Feasibility financially, technically, and operationally. This involves looking at resource availability, potential risks, and the estimated impact. You may not have the luxury of doing this when you start (e.g. you inherit a programs viability on an ongoing basis will help you to plot a course to ensure both the program and its usefulness to the company are maintained. Initial & Ongoing Resource Allocation: Determining what resources are required to kick-start the program. This includes human resources, technology, finances, and other necessary tools. Then as you move forward, revisit these resources frequently to ensure youre not over or under spending in order to delivery on your key objectives. High-Level Planning: Sketching out a high-level plan that outlines the major phases, key deliverables, and tentative timelines. This high-level blueprint will provide you with a north star to ensure your on the right path. The Importance of Program Formulation The formulation phase is critical as it sets the stage for everything that follows. It provides a clear direction and a robust framework for the program, ensuring that every subsequent decision and action contributes effectively towards the set goals. This phase also helps in identifying potential challenges early on, allowing for proactive measures to mitigate risks. As the foundational step in the program life cycle, formulation is where the blueprint for success is created. It requires strategic thinking, careful planning, and a comprehensive understanding of the programs goals and its alignment with organizational objectives. We highly suggest gong through each of the above steps to establish a solid foundation and set of artifacts to help guide you. Navigating this phase effectively paves the way for a well-structured and successful programme management The deliverable that terminates the identification phase of programme cycle management) is the Programme scope document. The deliverable that terminates the designing phase (and opens the of implementation phase of the programme cycle management) is the Programme cycle management) is the Programme cycle management. Programme formulation is the process of choosing the who, what, how, when, and where of persuing programme objectives. Since we are moving at a programme level there will be decisions regarding particular projects, but only decisions about how to set up a system that will make project management and integration possible. During programme implementation projects will be designed which will focuses on defining clear, discrete activities and the work needed to complete them. So program plans generally do not contain many details on the stage of project design at the stage of project origination. What the programme formulation will indicate is a list of programme specific objectives (that will become the overall objectives and a list of possible actions and development sectors that are considered to be suited to the achievement of programme objectives. A good will also describe how the achievement of these objectives is expected to have a wider impact thanks to the use of project stakeholders. Program formulation therefore provides a framework where different projects, sharing the same overall objectives, can be conceived and implemented in a co-ordinated manner. (See also: the 3 level hierarchy of project/programme objectives). A programme will generate benefices for internal and external stakeholders; there is a success. A programme plan may have a different format according if it is meant for the project partners as external stakeholders. When the plan is meant mainly for an audience of internal stakeholders the operations plan may contain more details for specifying all the tasks required for managing the activities and delivering the expected products/services. However in many cases external stakeholders like donors and other partners will be interested to see such details and monitor the implementation of activities because they have to justify to others the resources they have invested in the project/programme. In all group relationships, there will be some self-interest that may not be in line with the common interest, like some people saving their time and putting inadequate effort in their tasks, vendors charging higher costs, leaders claiming responsibility of all the successes and blaming others for the problems, etc. A good programme plan will minimize conflict of interests as much as all the reciprocal expectations are well defined and a commented and a system of monitoring and support is in place. Planning is not everything: team spirit and a visionary leadership are essential for a project success; but without a good plan misunderstand and disappointment will almost be inevitable. In this stage a logical framework can be prepared for summarising and schematizing the programme purpose and strategy. the origination, supervision and evaluation of project. A budget for these program-level activities may be defined. But in a really projectized organization program developers will not develop project details as this will be done a coordinated effort with project managers and project teams. A programme should contain budget indication regarding what is the expected cost of the projects and of project origination, supervision and evaluation. it should also give inductions on how the project financial planning and management) A good program will also identify and attribute specific responsibility in the programme management team in generating project and animate the process of producing the programme results chain (from project deliverable to outcomes, up to programmes impacts) so that the steps of the process are specifically attributed to the managerial structure, where specifically attributed to the managerial structure, where specifically attributed to the managerial structure. for expected results; considering internal audit and budget tracking as programme implementation actions, so reporting about them clearly and evaluate their efficiency and transparency. (See Programme Governance; clarifying the relationship: Responsibilities of Project Managers and programme Managers) A good programme design will give answers to the following questions: While designing the project design in deciding the specific objectives, the general object is also calledex ante evaluation. An organization aiming at programme program quality should establish a system of Monitoring and Evaluation. In fact in order to ensure programme or project is being implemented according to plans and assess whether the programme of project is resulting in the anticipated changes or impacts (thereby fulfilling the basic requirement for a learning organization); identify the need and the scope to raise the capacity of the human resources of the organization to manage successfully their task and contribute to the generation of a healthy communication. A good programme design will consider how to monitor and evaluate during and after the implementation phase (in itinere and ex post). It will therefore decide what are the sources of information for judging the efficiency, the effectiveness and the impact. Information sources may be independent from the programme/project management team and the organization. Others will be the internal evaluation tasks that will collect data concerning processes and outcomes. Programme designers will consider the standard methods of collecting and analyzing data and will adopt those that are seen as most suitable. there will be an illustration of the evaluation activity within the program/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation activity within the program/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring/evaluation results for improved programme/project, including the indications regarding how to use the monitoring acceptance for the evaluation reports). The elements of an evaluation action are illustrated in the chapter on program evaluation actional culture and management style is a fundamental requirement for generating an organizational imagethat is a prerequisite for a successful partnership management. The Programme Plan is the that terminates the designing phase (and opens the of implementation phase of the programme quality plan You may consider subsections for: Logistic, Monitoring & Evaluation, Quality Mananagement, Risk management, Team Training, Project Communication management, Issues Checklist see Programme Execution Checklist Guidelines: Plan Writing Other resources: (Europe Aid: PCM Manual) Issues to be considered in Program Formulation 3.2 Project Pre-Phase A: Concept Studies 3.4 Project Phase A: Concept and Technology Development3.5 Project Phase B: Preliminary Design and Technology Completion3.6 Project Phase C: Final Design and Fabrication3.7 Project Phase E: Operations and Sustainment 3.9 Project Phase E: Operations and Sustainment 3.9 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.6 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration and Technology Completion3.7 Project Phase D: System Assembly, Integration3.7 Project Phase D: System Assembly, Integration Customization of NPR 7123.1 Requirements The program Formulation Phase establishes a cost-effective program that is demonstrably capable of meeting Agency and mission directorate goals and objectives. The program Formulation Document (FAD) authorizes a Program Manager (PM) to initiate the planning of a new program and to perform the analyses required to formulate a sound program plan. The lead systems engineer provides the technical planning includes identifying the major technical reviews that are needed and associated entrance and exit criteria. Major reviews leading to approval at KDP I are the SRR, SDR, PDR, and governing Program Management Council (PMC) review. A summary of the required gate products for the programs, NPR 7120.5 for space flight programs, NPR 7120.7 for IT projects, NPR 7120.8 for research and technology projects). Formulation for all program types is the same, involving one or more program reviews followed by KDP I where a decision is made approving a program to begin implementation. In some ways, a program management lifecycle is similar to a project management lifecycle. For example, both include initiation, execution, and closure phases or sub-phases. A project management lifecycle is ongoing and strategic to the organization. A program lifecycle can extend much longer, with a program continuing for years before its closed. Learn more about the differences between program management and project and portfolio management and project and portfolio management and project management and pr handbook will help you:Identify pain points in your current processesLearn from examples of businesses using modern PPM strategiesImplement your own updated PPM strategiesImplement your own updated program and, if they decide to start the program, to build it on a solid foundation. Some experts consider these five steps to be part of the program management lifecycle phase begins. Other experts consider this pre-planning to be part of the program management lifecycle phase. In either case, the pre-planning tasks are similar and will set your program up for success. They include these five key steps: Identify Your Mandate: Decide what the organization is trying to accomplish as it considers setting up a program. Understand the Strategic Value of the Proposed Program. strategic goals of the organization. Identify and Assign the Sponsor: Find a top leader within the organization to sponsor the program. The sponsor must agree with the creation of the program. The sponsor must agree with the creation of the program. connected to your organization will care about the program and its goals. Take time to assess and understand the expectations those stakeholders will have for the program will accomplish? Find and Assign the Program will accomplish? Find and Assign the Program will accomplish? and assign them as your program manager. Learn more about the essential skills needed to become a good program manager in our comprehensive guide to program manager in our comprehensive guide to program manager. or not to set up a program. Many experts consider the program management lifecycle to have three primary phases: program definition, program defin on these program management phases. All of the variations have some similarities in how they outline the development of a program: Below, youll find more detailed information on these three primary phases, as well as expert advice on successfully implementing each phase of your program. In the program definition phase, the object is to establish the reason for the program and define goals and objectives. In this phase, you also acquire final approvals for the program, set up the program, set up the program define goals, says Yad Senapathy, founder and CEO of the Project Management Training Institute. They take these goals and objectives and translate them into an organizational strategy. This organizational strategy typically could spin into multiple sets of portfolios, then have the program then looks up to this organization strategy, looks up to this organizational strategy. around the purpose of the program objectives, says Jake Carroll, the founder of Create Kaizen. Whats the mission of the program? Its really answering all of the questions: why are we tackling this versus some other issue? Just at the beginning, Caroll says, standing up a program may feel a little bit like project management in that you have some sort of defined scope that you need to get buy-in and investment for. You need to have a little bit of a sense for how long it's going to take to build this. Learn more with our comprehensive guide to best practices in program management. The program definition phase has two sub-phases: program formulation and program preparation. Below is detailed information about these two sub-phases and some tips on how to approach them: Program Formulation Sub-PhaseSome experts, however, consider those tasks to be part of the program formulation sub-phase within the program definition phase. In either case, program formulation involves important steps in establishing the program and setting it up for success. The main components of the program formulation sub-phase are as follows: Create the Business Case: Early in this sub-phase are as follows: Create the Business Case for setting up the program. Why will the cost of the program be worthwhile to the organization? How will it serve the organizations strategic objectives? Carroll explains that the business? Otherwise, why would any executive want to sign off on the development of that program? You need to understand what is the business case for even creating this specific program, says Senapathy. A strong business that we need to address as part of this program. The program is trying to deliver these strategic initiatives. Use the following strategic goals checklist to help create a program stays focused on that ultimate mission. Download Program Strategic Goals ChecklistMicrosoft Word |Adobe PDF | Google DocsSecure Program Financing: After you establish the business case, youll need to secure all necessary approvals to finance the program Create Program Charter: The program objectives, potential benefits, and scope, as well as how the program objectives, potential benefits, and scope, as well as how the program objectives. charter is saying: Here are certain objectives that the program wants to change. Here's a sponsor who wants to stick in a certain amount of money to this, and the sponsor is putting their weight behind this program. And here's this rough sketch of scope, schedule, and finances. Now we are blessing it. In other words, the program manager is official. The program is official. The objectives are official. For additional resources, see our collection of program management templates, including a program charter templates, including a program. What work and areas will it not cover? Perform Initial Study of Cost: Assess your expectations for startup and ongoing costs of the program. The types of questions you might ask at this stage, Carroll says, include, What types of resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking those resources are we going to need? Who are we actually taking the need? Who a opportunity costs on whatever they're going away from. Its a double investment. Program managers must also think in these early phases about short- and long-term costs of projects within the program, says Rick Cherf, associate professor at Washington State University and founder of Total Construction Services, Inc. A building may last anywhere from 40 to 100 years, depending on the quality of the construction. Then you manage that facility maintenance and repair all of those things are important. Perform Initial Resource Estimate: Along with costs, you will want to determine which resources you can make available to the program. That could be planning the execution and what that program actually looks like, says Carroll. Whos going to be involved? What resources like money. You also need to develop some sort of timeline for the program. If your organization has a program management office, use them as a resource to help with this step and other steps in the formulation sub-phase. Learn more about programs succeed with our comprehensive guide. Perform Initial Risk Assessment: Identify the likely risks to the program and how you will set up a structure to manage those risks. When we bring this team together for a program analysis, says Cherf, one of the questions you ask is: Whats going to keep us awake at night? Your team should perform a detailed assessment of all those possibilities. Then we put those up on the board and start talking about the critical issues we have to deal with, Cherf continues. Cherf shares one story about a program he worked on while building the \$2 billion Tacoma Narrows Bridge across Puget Sound in Washington. Program leaders found that 60 percent of the cables were in danger of rusting. That means youd have to buy 1.6 times as much cable, which would cost about \$20 million more. So they got an insurance program from Lloyds of London, and they also talked to the cable manufacturers to make sure they put a certain kind of coating around the cables. All those little things could impact you. You talk to the people who are responsible for those portions of the program, and you ask them: Whats going to bite us? What do we need to do? So when it happens, we're not sitting around going, Oh my God. Weve already thought about that. Create Program Plan: The program plan is more detailed than the program plan is more detailed than the program plan is more detailed than the program Plan: preparation sub-phase. A program management plan is a how-to, says Senapathy. How do you go about implementing the whole program? How do you interact with one another? When a change occurs, is there a system to follow? How do you manage scope within the program? How do you manage the schedule of the program? How does financial management occur within a program? I like to use the word framework, says Cherf. Its a framework. Were putting together the assumptions, the deliverables, the what do we need to do? What kind of framework do we want to set up to make sure that we're operating in the right? Program Preparation Sub-PhaseIn this sub-phase, your team might finalize the program plan, set up a detailed governance system, and better define the program sarchitecture. The purpose of this sub-phase is to get your program ready for launch. The following are the main components of the program sarchitecture. use to manage the program. Developing Benefit Realization Plan: Determine how you will assess and measure benefits of the program. Identify program team. Identify program Team: Decide who you want on your program. Identify program. Identify program team. Identify program. Identify objectives to help focus the programs work. This is answering the why, says Carroll, and includes internal operations goals. This also helps with scope creep when stakeholders want to add different nuances that they prefer but that may not help the original vision and purpose. Define and Sequence Activities: Define activities that are important for the beginning of the program. When you complete those early activities, move the program definition and early phase analysis will differ between bigger, more established companies and smaller, younger companies. I think people pick and choose the components of program definition analysis depending on the needs of their company, Carroll says. I did what I would consider a fairly robust lifecycle management for a growth stage company that 's in a hypergrowth stage, thats much more rigorous than for a startup. The program benefits delivery phase is the phase in which your team will start work on various components of the program and begin working to meet program objectives. Many experts consider this phase to have three sub-phases, which include component authorization and planning, component oversight and integration, and component authorization and planning sub-PhaseIn the component for the program and begin working to meet program objectives. authorization and planning sub-phase, your team will establish the components of the program or the individual projects that comprise the program as a whole. These projects should each address specific objectives that your organization established in the program definition phase. In this phase, your organization may also assign team members to do the work on specific projects within the program. Component Oversight and Integration Sub-Phase During the component oversight to make sure all projects are integrated with each other and with the overall program goals. The following are some important steps within the component oversight and integration sub-phase: Initiating projects that will ultimately deliver benefits Managing the transition from your organizations current state to its new state as the progress against the objectives laid out in your planIdentifying and monitoring for issues that might diminish the benefits that youre expecting the program to produceCoordinating to ensure the program is using resources efficientlyCommunicating with important stakeholdersComponent Transition and Closure Sub-PhaseIn the component transition and closure sub-phase, your teams will work to successfully finish projects after they and the component transition and closure sub-phase. delivered benefits. Next, they will begin the transition to other ongoing work. Some experts also recommend a fourth sub-phase called benefits appraisal, leaders might call to end the program because it has met its objectives. On the other hand, they might choose to expand or otherwise change the program. At this point, Carroll says, organization leaders should ask the following questions: Whats our return on investment? If we were to look forward, should we either expand the current scope of this program or pivot the scope of the program to tackle a new issue? Or scrap the program completely? What do those different scenarios look like? What you often find, Carroll continues, is that you have a lot of existing programs that need to be maintained, or they need to grow and serve new user problems, whether the user is a customer to the company or internal employees. You might need further investment. You might need to tweak the way people work in order to get more out of the current investment. I think this is all encompassed in this reflection period. The program benefits and determine how unresolved work will be completed. This phase is also an excellent opportunity to reflect on the program successes and failures and synthesize all the lessons learned. Some experts also call this the dissolution stage. Many experts consider the program transition and program transition sub-phases program transition and program transition sub-phase. program transition sub-phase, your team will assess and document the benefits of the program and ensure that there is a plan in place to complete any unfinished work. Program Closeout sub-phase. This phase may include dispensing of certain technical resources or reassigning team members to new projects. Program leaders document and deliver final records on the program, and the team completes a final program, unforeseen risks, and other information that will be useful as your organization creates and operates new programs in the future. As you complete the program may happen during the component transition or the closure sub-phase of the benefits delivery phase. Either way, you will want to do a final assessment of the successes and failures of any program that is ending. There needs to be some sort of retrospective, Carroll says. Some people call it a post-mortem, but that's usually more negative. It's a retrospective on how the entire process went. What were our original goals? Did we meet those goals? Review of Program Benefits: Youll want to review benefits of the program, as well as intended benefits that werent realized, with key stakeholders. Lessons Learned in future actions your organization can take to ensure any problems or challenges in the closed program are lessened or eliminated in future programs. Program Disband: Programs end for many reasons. but Senapathy says organization leaders often end them for one of two contradictory reasons. In some cases, the program isnt achieving what it needs to achieve and the financial drain is so bad that key executives are beginning to notice it significantly. They just need to pull the plug, Senapathy says. All program activities fit within program phases. By embracing an adaptive program management lifecycle, your team will continually assess how programs are working and adapt plans and strategies as needed. Program benefits and challenges and assessing new business opportunities. In an adaptive program management lifecycle, the program management process is iterative. Plans change more frequently, even if it means diverging from the plan that program managers may have written months before. Oftentimes, the adaptive nature of taking new information and reacting to it is more important than anything else, Carroll says. From simple task management and project planning to complex resource and portfolio management, Smartsheet helps you improve collaboration and increase work velocity -- empowering you to get more done. The Smartsheet platform makes it easy to plan, capture, manage, and report on work from anywhere, helping your team be more effective and get more done. happens with roll-up reports, dashboards, and automated workflows built to keep your team connected and informed. When teams have clarity into the work getting done, theres no telling how much more they can accomplish in the same amount of time. Try Smartsheet for Free Get a Free Smartsheet Demo
